

Amendments to the Claims

1 Claim 1 (previously presented): A system comprising:

2 a personal digital assistant including a memory defining a database, a
3 microprocessor coupled to the memory, an input/output device coupled to the
4 microprocessor, a wireless modem coupled to the microprocessor, and an output
5 port coupled to the microprocessor, the personal digital assistant being configured
6 to provide data to the output port indicating a predetermined event has occurred in
7 response to occurrence of the predetermined event; and

8 actuator circuitry including a digital to analog converter having a digital
9 input coupled to the output port, having an analog output, and being configured to
10 provide an analog signal in response to the data being applied to the digital input,
11 and the actuator circuitry including a conductor configured to be coupled between a
12 vehicle's horn and the analog output of the digital to analog converter, the actuator
13 circuitry being configured to effect different patterns of honking of the horn for
14 different predetermined events in response to the data being provided to the digital
15 input of the digital to analog converter to distinguish between different types of
16 predetermined events.

1 Claim 2 (previously presented): A system comprising:

2 a personal digital assistant including a memory defining a database, a
3 microprocessor coupled to the memory, an input/output device coupled to the
4 microprocessor, a wireless modem coupled to the microprocessor, and an output
5 port coupled to the microprocessor, the personal digital assistant being configured
6 to provide data to the output port indicating a predetermined event has occurred in
7 response to occurrence of the predetermined event, wherein the personal digital
8 assistant includes an e-mail client, and is configured to provide data to the output
9 port indicating that an e-mail has been received in response to an e-mail being
10 received via the wireless modem; and

11 actuator circuitry including a digital to analog converter having a digital
12 input coupled to the output port, having an analog output, and being configured to
13 provide an analog signal in response to the data being applied to the digital input,

14 and the actuator circuitry including a conductor configured to be coupled between a
15 vehicle's horn and the analog output of the digital to analog converter, the actuator
16 circuitry being configured to effect honking of the horn in response to the data
17 being provided to the digital input of the digital to analog converter.

1 Claim 3 (previously presented): A system in accordance with claim 2
2 further including a battery charger having a power input plug connector configured
3 to be coupled to a vehicle cigarette lighter power port and having an output
4 connector, wherein the personal digital assistant includes a rechargeable battery
5 and has a connector port configured to be coupled to the output connector of the
6 battery charger.

1 Claim 4 (previously presented): A system in accordance with claim 2
2 wherein the actuator circuitry is configured to effect a pattern of discrete spaced
3 apart honks in response to the data being provided to the digital input of the digital
4 to analog converter.

1 Claim 5 (original): A system in accordance with claim 4 wherein the
2 actuator circuitry is configured to generate different patterns of honks for different
3 predetermined events to distinguish between different types of predetermined
4 events.

1 Claim 6 (original): A system in accordance with claim 3 wherein the
2 actuator circuitry is coupled to the power input plug connector, to be powered by
3 the vehicle.

1 Claim 7 (original): A system in accordance with claim 3 wherein the
2 battery charger includes charger circuitry, and wherein the system further
3 comprises a common housing supporting the digital to analog circuitry and the
4 charger circuitry.

1 Claim 8 (previously presented): A system in accordance with claim 2
2 wherein the personal digital assistant further includes mobile phone circuitry,
3 including ringer circuitry configured to provide a signal to actuate ringing when a
4 phone call initiation attempt is being received, wherein the personal digital assistant
5 is further configured to provide data to the output port indicating that a phone call
6 initiation attempt is being received, in response to the ringer circuitry indicating that
7 a phone call initiation attempt is being received.

1 Claim 9 (previously presented): A personal digital assistant-vehicle
2 interface system, for use with a personal digital assistant including a memory
3 defining a database, a microprocessor coupled to the memory, an input/output
4 device coupled to the microprocessor, and a serial output port coupled to the
5 microprocessor, the personal digital assistant being configured to provide data to
6 the output port indicating a predetermined event has occurred in response to
7 occurrence of the predetermined event, the interface system comprising:
8 actuator circuitry including a digital to analog converter having a digital
9 input configured to be coupled to the serial output port of the personal digital
10 assistant, having an analog output, and being configured to provide an analog signal
11 in response to the serial data being applied to the digital input, the analog output
12 being configured to be coupled to an electrically actuated vehicle component that,
13 when actuated, is audible or visible, the actuator circuitry being configured to effect
14 actuation of the vehicle component in response to the data being provided to the
15 digital input of the digital to analog converter, wherein the actuator circuitry is
16 configured to effect different patterns of actuations for different predetermined
17 events in response to the data being provided to distinguish between different types
18 of predetermined events.

1 Claim 10 (previously presented): A system in accordance with claim 9
2 wherein the personal digital assistant further comprises a battery charger connector,
3 and further comprising a battery charger comprising a power input plug connector
4 configured to be coupled to a vehicle cigarette lighter power port and an output
5 connector configured to be coupled to the battery charger connector of the personal

6 digital assistant, the system further comprising a housing enclosing both the battery
7 charger and the actuator circuitry.

1 Claim 11 (original): A system in accordance with claim 10 and further
2 comprising a personal digital assistant including a memory defining a database, a
3 microprocessor coupled to the memory, an input/output device coupled to the
4 microprocessor, and an output port coupled to the microprocessor, the personal
5 digital assistant being configured to provide data to the output port indicating a
6 predetermined event has occurred in response to occurrence of the predetermined
7 event.

Claims 12-13 (cancelled).

1 Claim 14 (original): A system in accordance with claim 10 wherein
2 the actuator circuitry is coupled to the power input plug connector, to be powered
3 by the vehicle.

1 Claim 15 (previously presented): A personal digital assistant-vehicle
2 interface system, for use with a personal digital assistant including a serial output
3 port, a wireless modem and an e-mail client, the personal digital assistant being
4 configured to provide data to the output port indicating a predetermined event has
5 occurred in response to occurrence of the predetermined event and to provide data
6 to the output port indicating that an e-mail has been received in response to an e-
7 mail being received via the wireless modem, the interface system comprising:
8 actuator circuitry including a digital to analog converter having a digital
9 input configured to be coupled to the serial output port of the personal digital
10 assistant, having an analog output, and being configured to provide an analog signal
11 in response to the serial data being applied to the digital input, the analog output
12 being configured to be coupled to an electrically actuated vehicle component that,
13 when actuated, is audible or visible, the actuator circuitry being configured to effect
14 actuation of the vehicle component in response to the data being provided to the
15 digital input of the digital to analog converter.

1 Claim 16 (previously presented): A system in accordance with
2 claim 15 wherein the personal digital assistant further includes mobile phone
3 circuitry, including ringer circuitry configured to provide a signal to actuate ringing
4 when a phone call initiation attempt is being received, wherein the personal digital
5 assistant is configured to provide data to the output port indicating that a phone call
6 initiation attempt is being received, in response to the ringer circuitry indicating that
7 a phone call initiation attempt is being received.

Claims 17-20 (cancelled).

1 Claim 21 (previously presented): A system in accordance with claim 1
2 wherein the personal digital assistant includes an e-mail client, and is configured to
3 provide data to the output port indicating that an e-mail has been received in
4 response to an e-mail being received via the wireless modem.

1 Claim 22 (previously presented): A system in accordance with claim 1
2 wherein the personal digital assistant includes mobile phone circuitry, including
3 ringer circuitry configured to provide a signal to actuate ringing when a phone call
4 initiation attempt is being received, wherein the personal digital assistant is
5 configured to provide data to the output port indicating that a phone call initiation
6 attempt is being received, in response to the ringer circuitry indicating that a phone
7 call initiation attempt is being received.

1 Claim 23 (previously presented): A system in accordance with claim 1
2 further comprising a battery charger comprising an output connector and a power
3 input plug connector configured to be coupled to a vehicle cigarette lighter power
4 port and, the personal digital assistant further comprises a rechargeable battery and
5 a connector port configured to be coupled to the output connector of the battery
6 charger.

1 Claim 24 (previously presented): A system in accordance with claim
2 23 wherein the actuator circuitry is coupled to the power input plug connector.

1 Claim 25 (previously presented): A system in accordance with claim
2 23 wherein the battery charger further comprises charger circuitry, and the system
3 further comprises a common housing supporting the digital to analog circuitry and
4 the charger circuitry.

1 Claim 26 (previously presented): A system in accordance with claim
2 11 wherein the personal digital assistant includes a wireless modem coupled to the
3 microprocessor, and includes an e-mail client, and is configured to provide data to
4 the output port indicating that an e-mail has been received in response to an e-mail
5 being received via the wireless modem.

1 Claim 27 (previously presented): A system in accordance with claim
2 11 wherein the personal digital assistant includes mobile phone circuitry, including
3 ringer circuitry configured to provide a signal to actuate ringing when a phone call
4 initiation attempt is being received, wherein the personal digital assistant is
5 configured to provide data to the output port indicating that a phone call initiation
6 attempt is being received, in response to the ringer circuitry indicating that a phone
7 call initiation attempt is being received.

1 Claim 28 (previously presented): A system in accordance with claim
2 15 further comprising a battery charger comprising an output connector and a
3 power input plug connector configured to be coupled to a vehicle cigarette lighter
4 power port and, the personal digital assistant further comprises a rechargeable
5 battery and a connector port configured to be coupled to the output connector of
6 the battery charger.

1 Claim 29 (previously presented): A system in accordance with claim
2 28 wherein the actuator circuitry is coupled to the power input plug connector.

1 Claim 30 (previously presented): A system in accordance with claim
2 15 wherein the actuator circuitry is configured to effect a pattern of actuations of
3 the vehicle component in response to the data being provided to the digital input of
4 the digital to analog converter.

1 Claim 31 (previously presented): A system in accordance with claim
2 30 wherein the actuator circuitry is configured to generate different patterns of
3 actuations for different predetermined events to distinguish between different types
4 of predetermined events.
